Thanks for keeping me in the loop. I will let you know how things are going on this end.

Thanks
Megan

Hi,

Agree with most of this but not about NZDF. Ross just isn't going to see things our way. I've had previous conversations with him about this and he'd OIAed my notes from the conversation almost immediately afterwards.

Charlie

Hiya, to chat later but we made the decision not to 'front' any broadcast media - it will simply put a 'face' to the matter and it's not ours to own, as such. So were just sticking to written - just looking at the Friday morning 'maybe' below. :-)

Last email on this

RNZ happy to get the statement tonight in lieu of an interview tomorrow morning

They may be keen to talk to us on Friday morning but I will advise more tomorrow on that

Glenn Conway

FYI I've also sent RNZ our media statement on the new MoH guidelines

Glenn Conway

same for houses where the drug has been manufactured but is four times higher for houses where the drug has only been used and where there isn't any carpet or the carpet is removed. The level is three times higher for houses where only drug use is found, but where there is still carpet in the house.

The report notes that drug residue on carpets is more likely to result in chronic exposure to contamination for babies or toddlers who spend more time in contact with the floor.

The different levels reflect the level of health risk from living in a house where someone smoked methamphetamine, and living in a house used to manufacture the drug.

Living in a methamphetamine laboratory environment means potential exposure to chemicals at sufficient level to be linked to adverse cardiovascular, respiratory and dermal effects from exposure to methamphetamine, organic solvents, acids, alkalis and other chemicals.

But people living in a house where previous occupants had only smoked methamphetamine means potential exposure to low

is currently being developed.

While the Ministry's recommendations are being considered by the Standards Committee, its recommendations will be placed on the Ministry's website alongside its existing guidelines.

The new NZ Standard, once developed, will supersede the Ministry's existing Guidelines.

The Ministry of Health, which is also on the NZ Standards Committee considering the issue, will be working with agencies involved to look at how to promote information about the new standard when it's developed.

The recommended levels identified in the report are:

0.5 µg/100cm² for houses where the drug has been manufactured (unchanged)

1.5 µg/100cm² for houses where the drug has only been used – carpeted

2.0 µg/100cm² for houses where the drug has only been used - uncarpeted

ENDS

Background:

Several agencies have roles related to the remediation of methamphetamine

advice on the values for remediating methamphetamine contaminated buildings. The scope included seeking advice on both remediation of properties used as clandestine labs and solely for recreational use.

The ESR report has now been received by the Ministry and the recommendations form the advice the Ministry is presenting to Standards NZ Committee which is working on the development of the new meth standards.

The analysis includes a review of evidence and comparison of the risk assessment approaches used in New Zealand, Australia, Colorado and particularly California (which is based on a comprehensive review of the toxicological literature, using human data, and noted as the preferred comparison value for a safe daily exposure).

The ESR report also recommends an extra test for the presence of lead and mercury as part of the clean-up of clandestine labs.
